

# Lets Become Scientists

## THE ART OF OBSERVATION

One very important skill of a scientist is the art of observation. It is important to observe things, so we can learn all about them.

Observation means the action or process of closely watching or monitoring something or someone. In our case, the "something" is going to be our amazing Giant Weta!

Below we have had a go at drawing the body of a Giant Weta, but it's missing a few things.

Let's see how much we can observe in 5 minutes.

Sit and closely observe the Weta for 5 minutes, then see what extra body parts you can remember and draw them in. Think about how many legs it had? Did it have any spikes on it?

How did you get on with your drawing?
